

### Pre Treatment Information

The control agents used for the treatment in and around your home belong to the *Synthetic Pyrethroid* group, some of the characteristics are:

- They are broken down by soil micro-organisms; this means that they do not accumulate in the environment;
- Very low toxicity to warm blooded animals (humans) and birds;
- High potency to a broad range of insects;
- Non-staining, are not harmful to plants and have little, if any, smell.

Please take the time to prepare your premises to ensure you and your family get the maximum effectiveness from your treatment. The following should be done prior to our arrival;

1. All occupants need to vacate the premises for the duration of the treatment and for one hour afterwards.
2. Ensure that all washing is off the clothes line.
3. Close all external windows.
4. Remove animals and birds from the house, cover fish tanks (inside) with a tea towel or cling wrap; tanks and ponds (outside) should be covered with a tarp – pets should be removed from the premises during treatment.
5. All opened food packets should be placed into the pantry before we arrive for treatment.
6. Curtains, blinds and roller shutters should be left in an open position.
7. The driveway should be left clear, as it will be easier for us to access your residence.
8. It is a good idea to inform neighbours of the time and date that the treatment is taking place.
9. Payment needs to be made on the day by cash or cheque.

The above preparations are relevant for our 'General Pest Control treatments' as some pests require different treatments it is important for you to tell us about your particular concerns (infestations) at the time of making the booking. We can then advise of any additional preparations that you may need to undertake and we can allow significant time at your appointment to undertake the work required.

For any further information please feel free to contact us.
